

R3. Concatenation

Definition: The act of linking things together in a series. In programming, text can be concatenated with plus signs (+). Any strings that you are concatenating must be contained within quotation marks. Watch out for spacing!

When is it used? Concatenation is often used to link the value of variables (often user input) with programmer-determined text.

For Example:

Code

```
myName = "Bob"
```

```
print "Hello, " + myName + " ."
```

Result

Hello, Bob.

Your Tasks:

Tasks:	Your Answers:
What will the computer print if the following code runs? myCity = "Brooklyn" print "I am from " + myCity + " ."	
What grammatical error will appear when the computer runs the code below? myBedtime = "11pm" print "I go to bed at" + myBedtime + " ."
